

Metropolis-Hastings example

Florian Hartig

This example has been taken from this [blog post](#).

simulate test data

```
trueA <- 5
trueB <- 0
trueSd <- 5
sampleSize <- 31

set.seed(1500)
# create independent x-values
x <- (-(sampleSize-1)/2):((sampleSize-1)/2)
# create dependent values according to  $ax + b + N(0, sd)$ 
y <- trueA * x + trueB + rnorm(n=sampleSize, mean=0, sd=trueSd)

plot(x, y, main="Test Data")
```

Implementing MH algorithm

```
##### MH algorithm #####
run_metropolis_MCMC <- function(startvalue, iterations){
  chain = array(dim = c(iterations+1,3))
  chain[1,] = startvalue
  for (i in 1:iterations){
    proposal = proposalfunction(chain[i,])

    probab = exp(posterior(proposal) - posterior(chain[i,]))
    if (runif(1) < probab){
      chain[i+1,] = proposal
    }else{
      chain[i+1,] = chain[i,]
    }
  }
  return(chain)
}

# propose new parameter values
proposalfunction <- function(param){
  return(rnorm(3,mean = param, sd= c(0.1,0.5,0.3)))
}

# evaluate log posterior at given parameter values
posterior <- function(param){
  return (likelihood(param) + prior(param))
}

# evaluate log prior at given parameter values
prior <- function(param){
  a = param[1]
  b = param[2]
  sd = param[3]
  aprior = dunif(a, min=0, max=10, log = T)
  bprior = dnorm(b, sd = 5, log = T)
  sdprior = dunif(sd, min=0, max=10, log = T)
  return(aprior+bprior+sdprior)
}

# evaluate log likelihood at given parameter values
likelihood <- function(param){
  a = param[1]
  b = param[2]
  sd = param[3]

  pred = a*x + b
  singlelikelihoods = dnorm(y, mean = pred, sd = sd, log = T)
  sumll = sum(singlelikelihoods)
  return(sumll)
}
```

Run MH algorithm

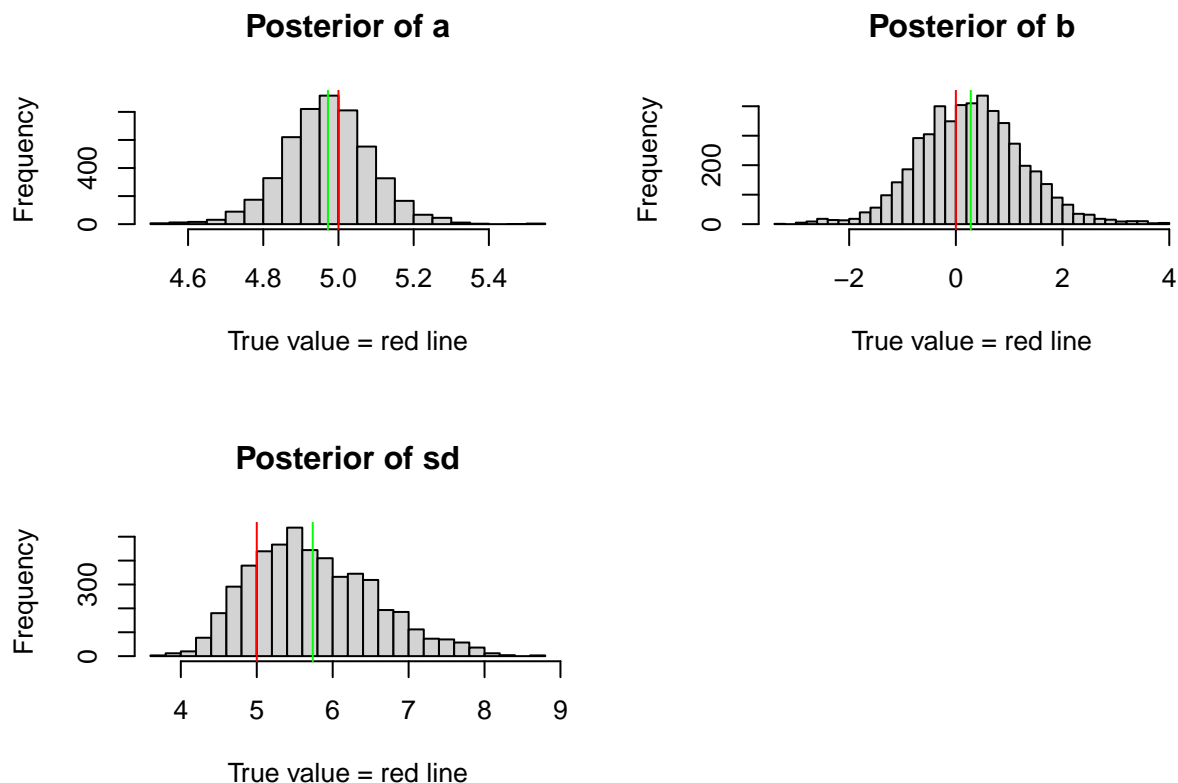

```
set.seed(1)
# initial value
startvalue = c(4,0,4)
# simulate 10000 samples
chain = run_metropolis_MCMC(startvalue, 10000)

# remove the first 5000 as burn-in
burnIn = 5000

# computing average acceptance probability
acceptance = 1-mean(duplicated(chain[-(1:burnIn),]))
acceptance

## [1] 0.6414717

par(mfrow = c(2,2))
hist(chain[-(1:burnIn),1],nclass=30, , main="Posterior of a", xlab="True value = red line" )
abline(v = mean(chain[-(1:burnIn),1]), col="green")
abline(v = trueA, col="red" )
hist(chain[-(1:burnIn),2],nclass=30, main="Posterior of b", xlab="True value = red line")
abline(v = mean(chain[-(1:burnIn),2]), col="green")
abline(v = trueB, col="red" )
hist(chain[-(1:burnIn),3],nclass=30, main="Posterior of sd", xlab="True value = red line")
abline(v = mean(chain[-(1:burnIn),3]), col="green")
abline(v = trueSd, col="red" )
```

```
# for comparison:
